## US Tells Russia That Time For "Apocalypse Equation" Is Now

By: Sorcha Faal, and as reported to her Western Subscribers

A chilling report on the phone call held between President's Medvedev and Obama prior to the public announcement that Osama bin Laden had been killed says that also discussed by the American President with the Kremlin was that the much feared time for the dreaded "*Apocalypse Equation*" may be now, not later.

The "*Apocalypse Equation*" refers to report authored by one of the most secretive women in US intelligence circles named Audrey Tomason [photo top left in White House Situation Room during the assault on bin Laden compound] who is Obama's Director for Counterterrorism and while attending Harvard's Kennedy School of Government wrote a master thesis [now classified by the US as "*top-secret*"] suggesting that it would be more humane for our world to undergo a "*planned and controlled genocide*" rather than to see it descend into the abyss of chaos it is now entering.

According to Ms Tomason's "*Apocalypse Equation*" the "*sustainable population*" of our world can only be 1.5 billion human beings, as compared to the United Nations estimate of 7 billion we will reach on October 31<sup>st</sup> of this year, and the even worse figure of 10 billion estimated by 2100.

Ms Tomason argues in her thesis that our world's population has been "*artificially inflated*" for the past nearly 100 years by a "*non-sustainable*" petrochemical and fossil fuel based global economy that if left "*unchecked*" could very well destroy all life on Earth, not just human beings.

Independent reports, unfortunately, strongly back Ms Tomason's dire warnings with one of the most disturbing graphics [2<sup>nd</sup> photo left] produced by the PostPeakLiving.Com research group showing that, indeed, our world's population has grown more since the use of petrochemicals than in all of its previous history.

Important to note about petroleum [otherwise known as crude oil] is that is a naturally occurring, flammable liquid consisting of a complex mixture of hydrocarbons that underpins the entire global economy and which without life as we know it would not exist.

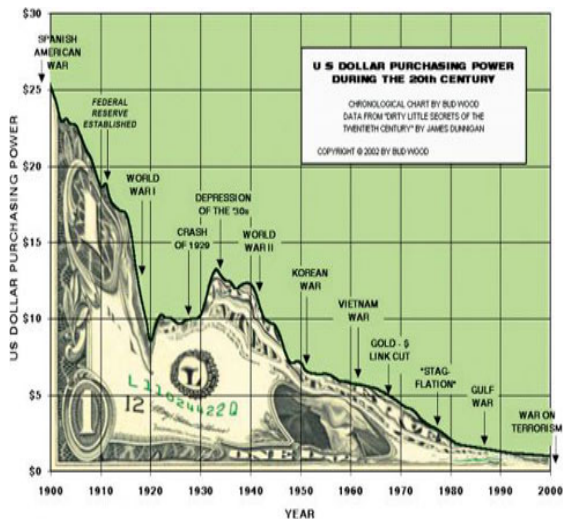

Most people believe that the major use petroleum is for the fueling of vehicles, boats and aircraft through its distillation into various fuels such

**World GDP Growth & World Oil Production Growth Have Tracked For Decades.**

For 1995-2006, Deutsche Bank calculated:

$$\frac{\% \text{ Change in World GDP}}{\% \text{ Change in Oil Supply}} \sim 2.5 \quad \text{Order of magnitude of } 1$$

as gasoline (petrol), diesel, jet fuel, and the like, but they couldn't be more mistaken as the major use of oil is in agriculture as nearly all pesticides, and many fertilizers, are made from it.

And the most critical fact facing our world today, as Ms Tomason's thesis points out, is that the "oil boom" of the last century is not only over, the fight by nation-states to preserve our Earth's dwindling supplies for themselves threatens global war on a scale never before seen in human history, and which, in fact, have already begun as the energy starved West continues to launch new wars to protect themselves from economic collapse.

Most amazing to note about our world's present predicament in regards to oil is that is one of the longest "slow motion train wrecks" in history as since 1956, it has been warned about.

In fact, it was in 1956 that the great Royal Dutch Shell geoscientist Marion King Hubbert (1903-1989) warned in his presentation to the American Petroleum Institute that our world was running out of oil and that the "peak" production of oil in the United States would be reached in 1970 and for the rest of the world in the first decade of the 21<sup>st</sup> century.

To visually illustrate his warning he created the now famous "Hubbert Curve" [4<sup>th</sup> photo left] that since its 1956 release has proved 100% accurate with the peak of global oil discoveries occurring in 1963 and the US, indeed, reaching the peak of its production in 1970.

At this point it is important to understand that nearly all Western governments continue to propagate their decade's long deception to their citizens over the grave state our world is in with regards to oil and energy resources, most especially in regards to the illusion that so called "green energy" projects can sustain us.

Nothing could be further from the truth as these "green energy" [solar, wind, geothermal, etc.] sources currently make up under .05% of total global energy production, do nothing for agriculture (the main use of oil), and to build them up to supply our world's total energy needs would cost more money than the world has, and would take nearly 200 years to complete.

Ms Tomason continues in her dire thesis that along with the energy and food "shocks" the global monetary systems will face collapse too as it has, likewise, been "artificially inflated" beyond "all sustainable measures" due to its link with oil production.

Making matters worse, Ms Tomason explains, is that since the United States reached its peak oil production in 1970, it failed to "counter-balance" its economy to reflect it, opting, instead, to keep its economy "artificially inflated" by decoupling the US Dollar from the gold standard in 1972 (called the "Nixon Shock") and allowing their currency to become, in essence, "worthless pieces of paper."

During the 20<sup>th</sup> century alone the US Dollar lost nearly 80% of its purchasing power [5<sup>th</sup> photo left] leaving tens-of-millions of Americans jobless as their once mighty manufacturing base was shifted to lower priced overseas markets, a situation termed "catastrophic" by Ms

Tomason, because the American currency is, also, our world's only reserve currency whose deflation has ensured the destruction of "everything."

To understand how enormous, and dangerous, this complex economic situation has become one has to realize that the Gross National Product (GDP) of the entire world is just over \$55 Trillion a year as opposed to over \$2,000 Trillion in total debt outstanding leading to what is called "The Great Credit Contraction" [6<sup>th</sup> photo left] which will, literally, evaporate all the wealth in the world virtually overnight.

Most important to understand about what will surely be the greatest economic collapse in human history is that "mainstream" economists will tell you nothing about it, and they reason they won't tell you is shocking, to say the least.

After the global economic collapse of 2008, Professor of Economics Dirk

Bezemer at the University of Groningen in the Netherlands conducted a survey of nearly all the world's economists to discover why none of the "mainstream" economists (even Nobel Prize winners) failed to see what was coming. What he discovered were exactly 11 researchers [see list of them [here](#)] who accurately predicted the 2008 economic collapse and they all had one thing in common when creating their models, they included debt.

That's right; nearly all of the economists in the world DO NOT factor in debt when creating their economic models leaving them worthless to predict what will happen, especially those working for governments having political motivations.

Ms Tomason, however, does include debt in her thesis and further warned that by 2011 the US Dollar "could very well begin crashing," and which a CNBC news report is, also, saying is now underway.

Upon the collapse of the US Dollar, Ms Tomason asserts in her thesis, the entire global economy will crash plunging billions of human beings, including hundreds-of-millions in Western nations, into the lowest scale of "Maslow's Hierarchy of Needs."

[Photo bottom left]

Maslow's Hierarchy of Needs is a theory in psychology, proposed by Abraham Maslow (1908-1970) in his 1943 paper A Theory of Human Motivation that, basically, states human beings will first strive for "Basic Needs" (survival) before they'll seek "Safety Needs" (comfort), and once having those needs met will strive next for "Psychological Needs", "Self-Actualization" and, finally, "Peak Experiences."

Ms Tomason states in her thesis that any population suffering an economic collapse and reverting to "Basic Needs" will be "ungovernable" and pose "tremendous risks" to the state leading to "wholesale breakdown of law and order."

Ms Tomason further argues in her "Apocalypse Equation" thesis that since the collapse of civilization as we know it is "inevitable," world leaders should consider the possibility of "mass genocide" to reduce our world's population to a more "sustainable level commensurate with our Earth's resources."

The chilling genocidal scenario envisioned by Ms Tomason begins with a "limited nuclear conflict" targeted at major population centers, but designed to limit the fallout of radiation. Next would be the release of toxic chemical and biological agents she suggests could be blamed on "terrorist entities" to be followed by forced mass migration of populations to more "sustainable living environments."

Ms Tomason envisions these "sustainable living environments" as being large population centers with mass transit systems where no personal vehicles would be allowed and the rural areas would be completely depopulated except for government run agricultural "systems."

Prior to the initiation of these apocalyptic events Ms Tomason argues for the establishment of government run and protected "concentration camps" where "persons of worth" can be protected while the masses of their fellow citizens die by the millions and billions. Those deemed "persons of worth" would include scientists, doctors, technical specialist, etc.
